SUMMARY

Senior software engineer with 4+ years of backend experience in PHP/Laravel, currently leading a 5-engineer team at GetPayin where I own architecture, infrastructure, and delivery of Paylink (payment aggregation) and a new multi-tenant SaaS booking platform on Laravel 12. Track record refactoring high-load systems for resilience via Redis queues, caching, and async offloading. Strong across the full backend stack: Filament, Pest, Horizon, Pulse, Docker, and CI/CD pipelines.

CORE SKILLS

Languages & Frameworks	PHP 8.4, Laravel 12, Filament 5, Livewire, Vue.js, JavaScript, C# / .NET
Architecture	Multi-tenancy, Service-oriented & Use-case-driven design, Clean Architecture, SOLID, DDD (light), REST APIs, Event-driven, Background Jobs
Databases & Caching	MySQL, MongoDB, Redis (queues + caching)
Cloud & DevOps	AWS, DigitalOcean, Docker, GitHub Actions, CI/CD pipelines
Testing & Quality	Pest 3, PHPUnit, Larastan, Pint, code review, mentorship
Observability	Horizon, Pulse, Telescope, structured logging
Languages (spoken)	Arabic (Native), English (Professional working — B2)

PROFESSIONAL EXPERIENCE

Senior Software Engineer · GetPayin — Fintech May 2025 — Present · Giza · Hybrid

GetPayin is a product-led fintech building Paylink, a payment aggregation platform connecting merchants with their customers. I lead the engineering team and own the architecture and delivery of new product lines.

- Lead a team of 5 engineers across architecture decisions, code review, and delivery cadence; introduced engineering standards (Pint formatting, Larastan static analysis, Pest test gates) that lifted code consistency and shortened review cycles.
- Architect and lead development of a new multi-tenant SaaS booking platform on Laravel 12, applying tenant-aware queues, isolated tenant data, service-oriented decomposition, and use-case-driven design — bridging product vision and engineering execution.
- Own end-to-end infrastructure: production databases, application servers, S3-compatible storage, environment promotion (dev → staging → prod), and GitHub Actions CI/CD with automated test gates.
- Designed and shipped Paylink backend features (payment aggregation APIs, merchant onboarding, transaction reconciliation) supporting **120+ merchants** and **8,000+ daily transactions** in production.
- Reduced p95 API latency from **~520ms to ~230ms (~55%)** via Redis caching for hot read paths and offloading heavy operations (notifications, exports, reconciliation) to Horizon-managed queues.
- Hardened tenant isolation through cross-tenant integration tests, queue tenancy bootstrappers, and architecture guards in CI — eliminating an entire class of data-leak risk before launch.
- Mentor engineers on Laravel best practices, multi-tenancy patterns, and testing discipline; conduct weekly code-review sessions and 1:1s.

Hypersender is a high-demand messaging platform offering API-based WhatsApp and SMS services. Owned the refactor and scaling of the main application built around the Action Pattern.

- Owned refactor of core messaging modules to improve scalability, maintainability, and stability under production traffic.
- Eliminated synchronous bottlenecks by offloading heavy API operations to background jobs with Redis-backed queues, increasing peak-throughput tolerance **~8x** (~200 req/s → ~1,500 req/s sustained) under traffic spikes.
- Redesigned subscription and payment workflows to simplify client onboarding and improve payment reliability — cutting failed-transaction rate from **~12% to ~4%** via idempotency keys, retry queues, and webhook deduplication.
- Implemented PDF invoice generation, improving billing transparency and removing recurring manual billing requests from support load.
- Designed and shipped an OTP verification system supporting both code-based and link-based flows, used to validate end-users in client integrations.
- Contributed to the open-source Laravel SDK ([hypersender-laravel](#)) — including merged PR #15 introducing `safeSendMessage()` and queued-request retrieval for production-grade integrations.

Software Engineer · *Future Group* — Email Reader System

Oct 2023 — May 2025 · Giza

Led a 2-developer team building an automated email-processing application that classified, routed, and responded to client emails using third-party APIs.

- Cut system response latency by **~92%** (~6s → ~0.5s) by introducing Redis caching on hot read paths.
- Reduced manual email-handling time by **~40%** by integrating third-party APIs into automated workflows.
- Containerized the application with Docker, cutting new-environment setup time by **~80%** and standardizing dev/staging/prod parity.
- Architected the system around MVC + modular service layers, improving long-term maintainability.
- Delivered a solution capable of processing **20+ jobs per hour** at steady state.
- Coordinated sprint planning, code reviews, and release cadence with the team.

Software Engineer · *Masasoft* — Hotel Management System

Feb 2023 — Oct 2023 · Giza

Built a hotel booking and management platform with a 4-engineer team.

- Delivered booking and check-in flows supporting **500+ monthly bookings** and a **~25%** reduction in check-in time.
- Authored **50+** optimized SQL queries for real-time room availability, improving data retrieval speed by **~30%**.
- Built payment processing for **500+ monthly transactions**, reducing payment errors by **~40%** via stricter validation and idempotency.
- Built a responsive frontend with intuitive booking flows and a calendar UI, reducing support inquiries by **~23%**.

SELECTED OPEN-SOURCE & PROJECTS

Hypersender Laravel SDK *Contributor* [github.com/hypersender/hypersender-laravel](#)

Merged PR #15: added `safeSendMessage()` and queued-request retrieval enabling production-grade integrations with retry semantics.

Hypersender Transport *Author* [github.com/khaledtarek54/hypersender-transport](#)

Laravel + Filament fleet management demo with availability engine, KPI dashboard widgets, and a Pest test suite (feature + unit).

Content Scheduler *Author* [github.com/khaledtarek54/Content-Scheduler](#)

Laravel API for scheduling cross-platform content. Sanctum auth, Redis-backed queues, rate limiting, Vue + Tailwind frontend. Demonstrates clean-architecture organization.

Course Management API *Author* [github.com/khaledtarek54/CourseManagementAPI](#)

.NET Core REST API following Clean Architecture with EF Core, JWT auth, and Swagger documentation. Demonstrates polyglot backend design.

MSA University — Giza, Egypt
B.Sc. in Computer Science

Oct 2017 – Oct 2021
